As part of its ongoing commitment to proactive diplomacy and to effectively address cyber threats to the U.S. and its allies, the Department of Defense (DoD) has revised and adopted its Modernized Executive Order (E.O.) 11905: Cyber Defense Policy Review to provide a one-stop shop for policy makers and all U.S. government employees as they engage in the cyber activities vital to the national interest. The revised E.O. stands up a Coordinating Committee for Conventional Defense and Security (CoCoComm) to coordinate activities between traditional military organizations and the cyber community. Existing federal executive orders and activities related to cybersecurity are reviewed by CoCoComm for continuity and consistency. This ensures that cyber doctrine is not maintained by one entity but rather a broader team that spans across the DoD and the policy-making authorities of the President, Congress, and relevant federal agencies and executive orders. CoCoComm works to provide a more unified approach to the cyber challenges facing our armed forces, which include preventing, detecting, and mitigating cyber attacks; ensuring the cybersecurity of military systems and networks; and increasing the capability and responsiveness of our cyber workforce. Cybersecurity is a critical part of military strategy. Cyber is an integral part of warfare and a vital tool for projecting U.S. military power, deter

Windows Media Player first came in contact with Windows 95 users back in 1995. Since then, Microsoft's media player helps you play multimedia content on your computer out-of-the-box. That seemed to be a problem for some people, as it took almost 10 years for the European Commission to realize that Microsoft was breaking some of their laws. There was a consistent fine paid by Microsoft and soon after, they released the "N" edition of Windows (Windows Media Player free edition). Windows Media Player 9 Codecs Pack lends a helping hand to users that experience problems while playing audio and video content in Windows Media Player mainly. It also provides the necessary codecs for web stream content. Its installation deploys the Windows Media Codecs to your computer, fixing the eventual errors generated by previously installed codec packs. Windows Media Video (WMV) is Microsoft's compressed video file format. Its original goal was to compete against the Internet streaming monopoly-owner RealVideo. Thus, if you didn't install Windows Media Player, you may stumble upon videos on the Internet that won't play. Still, if you don't want to install WMP, you can easily go for this pack and the WMV streams instantly start playing. Windows Media Player 9 Codecs Pack consists of several codecs that help your computer encode and decode audio and video streams automatically or on user demand. One of its components is the "WMSDMMOD.DLL", the media screen decoder of WMP. It enables the application to receive media streams both locally, across networks and the Internet. The codec pack also provides the Corona Windows Media Video Decoder DMO and the Windows Media Audio Decoder that work together to create image and sound from the media screen decoder to the screen of your computer. They are both components of the Windows Media Services and their primary objective is to decode and watch and / or listen to media streams. No matter the Windows edition installed on your computer, Windows Media Player 9 Codecs Pack's installation is recommended in order to provide a seamless WMV / WMA streaming experience. It brings the tools your system needs to put to good use whenever it is required. Eventually, this leads to smooth playback of media content that makes your viewing and hearing pleasure more enjoyable.

5 Provides Windows Media Audio Decoder and Windows Media Video Decoder. 5 Supported Platforms: Windows XP, Vista, 7, 8, 8.1, 10. Windows Media Video is one of the most used media player on the market. For people who use Windows Media Player, a problem may arise while trying to play a video. The cause of the problem may be the lack of codecs installed on your computer. However, this is now one of the problems that can be fixed with the help of the Windows Media Player 9 Codecs Pack. Below are some examples: The Windows Media Player application in Windows 7 If you're using Windows 7, you probably noticed that when you play a video, the sound may not be what you are expecting it to be. Sometimes, the sound has no bass, or is distorted in one way or another. May be you're not using Windows Media Player. The application may be made to automatically start automatically when you play a video. If you're not sure about this issue, you can remove the application, update it with this codec pack and the problem should be resolved. The Windows Media Player application in Windows 10 During a visit to a website, you will most likely notice that the website just provides a player that automatically executes the content you're trying to view. This is simply a way for a website to get you to subscribe to them or some other reason, however the way in which the video content is shown is often embedded in a code that isn't compatible with Internet Explorer. If you have the Windows Media Player, it will be compatible with this code and you can watch videos freely. The Windows Media Player application in Windows 8.1 Another common problem would be that your computer will just 'hang' during the video playback. This is especially common when using low-resolution videos or when the hardware doesn't have enough resources to run certain applications. This is also common when you have a low-speed connection to the internet. The Windows Media Player application in Windows 8 Once again, this is a problem that a lot of users have with the WMP. These users usually expect that the application will be available by default on their computer, especially with Windows 8. However, due to the fact that Windows Media Player wasn't available with Windows 8, you may need to install the application manually if you wish to watch videos.
