cstpatcher11.exe is a malware that evades detection by appearing as a trusted program from Microsoft. It was recently caught on this site and once downloaded, it executed the following commands: "cmd.exe /C cstpatcher11.exe "C:\\Program Files\\Microsoft Office\\Office14\\" shutdown -r -f -t 00" The malware only functions on Microsoft Windows PCs and has been declining in popularity since 2016. Individuals with antivirus software may detect the malware, but there is a possibility it will be detected as a false positive because of its low severity level according to Symantec's classification system. Another day, another ransomware attack. This time, it's the Weeping Angel Trojan that infects Microsoft Windows PCs, and it's even worse than the original (WannaCry). According to this article this Trojan appears to be around since 2014. The Trojans themselves don't cause any harm on the infected systems as long as they are not connected to the Internet. These Trojans can be used for illegal purposes such as stealing personal information from a user's PC via a man-in-the-middle attack.
